Introduction to Machine Learning

Instructor: Goker Erdogan (gokererdogan@gmail.com)

This course is intended as an introduction to machine learning with a focus on its applications in economics and business. We will start with the fundamentals of machine learning and build from linear models to modern deep learning techniques.

The course will consist of 20 hours of lectures with occasional exercises and programming assignments. Students are expected to have a basic understanding of calculus, probability/statistics, and linear algebra.

You can find an overview of the course content below. (See the end of this document for a detailed syllabus.)

1. Machine learning fundamentals

   - Overfitting and underfitting
   - Bias variance tradeoff
   - Curse of dimensionality
   - Cross validation
   - No free lunch theorem

2. Supervised learning - Linear models

   - Linear regression
   - Regularization
   - Logistic Regression
   - Support vector machines and other supervised learning techniques

3. Supervised learning - Tree based models

   - Decision trees
   - Random forests

4. Unsupervised learning

   - Principal components analysis
   - Clustering
   - Rule extraction/Basket analysis

5. Deep learning

   - Neural networks
   - Backpropagation algorithm

6. Putting it all together: Poverty prediction from satellite images

   - Transfer learning
   - Convolutional neural networks

Syllabus

1. Machine learning fundamentals I

   - AI vs. ML vs. Data Science vs. Business Analytics
   - Sample applications
   - Overview of the course

2. Machine learning fundamentals II

   - A motivating problem: Polynomial curve fitting
     - Overfitting and underfitting
     - Bias variance tradeoff

3. Machine learning fundamentals III

   - Another motivating problem: Nearest neighbor classification
     - Curse of dimensionality
   - Cross validation
   - No free lunch theorem
   - Two perspectives on ML: probabilistic vs. function approximation (optimization) perspectives

4. Supervised learning - Linear models I

   - Supervised / Unsupervised / Reinforcement learning
   - Regression vs. Classification

- Linear regression

5. Supervised learning - Linear models II

   - Regularization
     - L1 and L2 penalties
   - The probabilistic perspective
   - A sample application

6. Supervised learning - Linear models III

   - Classification
   - Logistic Regression
   - Solving logistic regression through gradient descent
     - Stochastic gradient descent
   - A sample application

7. Supervised learning - Linear models IV

   - Logistic regression: The probabilistic perspective
   - Limits of linear models

8. Supervised learning - Linear models V

   - Moving beyond linearity
     - Concentric circles example
   - Support vector machines and other supervised learning techniques

9. Supervised learning - Tree based models I

   - Decision trees
   - CART algorithm
   - A sample application

10. Supervised learning - Tree based models II

    - Bagging/boosting
    - Random forests
    - A sample application

11. Unsupervised learning I

    - Dimensionality reduction
    - Principal components analysis
    - A sample application

12. Unsupervised learning II

    - Clustering
    - K-means algorithm
    - The probabilistic perspective
      - Mixture of Gaussians
      - Soft K-means
    - A sample application

13. Unsupervised learning III

- Rule extraction/Basket analysis
- Apriori algorithm
- A sample application

14. Deep learning I

- Neural networks
- A brief history
- Fundamentals
- Backpropagation algorithm

15. Deep learning II

- Improving gradient descent
  - Momentum
  - ADAM
- Types of neural networks

16. Deep learning III

- Convolutional neural networks
- Modern deep learning frameworks
- A sample application: Poverty prediction from satellite images

17. Application: Poverty prediction from satellite images

- Putting it all together
  - Transfer learning
  - Convolutional networks
  - Mixture of Gaussians
  - Regularized least squares regression

18. Review

- Wrap up and review
- What we haven't talked about
  - Reinforcement learning
  - Sequential data
  - Inference in probabilistic models
- Further reading/resources
- Free time for questions etc.
